

1. page fault intro
 2. on-demand allocation
 3. classic use cases
-

1. PF intro

- on-demand allocation
- Cow forks
- memory mapped file

- PF is a type of exception.

- VM:

- ① translation: $VA \rightarrow PA$ \Rightarrow PTE
- ② protection: isolation + AC
- ③ a level-of-indirection \Rightarrow PF

"Any problem in computer science can be solved with another level of indirection."

-- Butler Lampson and David J. Wheeler

• RISC-V:

- ① 3 of cb \rightarrow PF (mcause)
- ② mtval \rightarrow faulted VA.
- ③ mepc \rightarrow instr triggered the page fault

Q: User or Kernel?

- user-level app is running
- MPP \rightarrow $\left\{ \begin{array}{l} 1 \rightarrow \text{kernel} \\ 0 \rightarrow \text{user} \end{array} \right.$
- 3D
- mepc

Q: VA ~~PA~~ or Perm Violation

• walk PT

2. on-demand allocation

0x82657c4

3. classic use cases

* copy-on-write fork

* overcommitting memory

* memory-mapped files

* pgfaults for user applications

RDMA

* DSM: distributed shared memory
